DEXPRO Apps

The **DEXPRO Apps** registry lists every installed DEXPRO module and lets you activate or deactivate each one. It is embedded as a part on the Core Setup card and is how DEXPRO Core knows which modules are present and which are currently active.

{add screenshot of Core Setup here}

Purpose

Each DEXPRO app registers itself with Core when it is installed. The registry gives you a single place to see the installed modules and to turn their functionality on or off, without uninstalling anything.

Fields

- **App / Name** — the DEXPRO module (for example SQUEEZE, Advanced Workflow, Freeze, eInvoice Sender).
- **Active** — a toggle that indicates whether the module is currently active. Turning it on or off synchronizes the module's own setup table so that Core and the module stay consistent.

Menu

- **Activate all Apps** — sets every listed module to active in one step.
- **Deactivate all Apps** — sets every listed module to inactive in one step.

Usage

- Open **Core Setup** and locate the embedded **DEXPRO Apps** list.
- Use the **Active** toggle on a line to activate or deactivate that module, or use the **Activate all Apps** / **Deactivate all Apps** actions to change every module at once.

When you toggle**Active**, Core updates the module's own setup table accordingly. This keeps the registry and the individual module setup in sync, so you can manage activation from one place.
