

# Permissions

You typically need:

- **DEXPRO AWF Admin:** for setup/template maintenance
  - **DEXPRO AWF User:** for usage/monitoring
  - **DEXPRO Core Administrator or DEXPRO Core User:** For rule creation/usage
- The app also includes the internal permission set **DEXPRO AWF Objects - Exec**. This set is **not assignable** and grants wildcard execute permission on all app building blocks (objects). It is used internally and does not need to be assigned to users.
