

Validation Findings

The **Validation Findings** page (DXP eInv Validation Result) shows the read-only, persisted findings of the last validation run for a document. Whenever the pipeline (or the live compliance check) validates a document, every rule that reported something is stored here so it can be reviewed after the fact - you are looking at the recorded result, not running the validation again.

{add screenshot of Validation Findings here}

Fields

- **Rule Id** - the identifier of the rule that produced the finding (for example an official BR-CO / BR-DE rule or an app-specific VAL-* rule).
- **Severity - Error, Warning or Information.** Errors block generation and transmission; warnings and information do not.
- **Field Caption** - the caption of the field the finding relates to, so you know exactly what to look at.
- **How to Fix** - a short, actionable hint describing the problem and how to resolve it in Business Central.

The stage a rule runs in (Source Data, Business Validation or Invoice Model) is configured on the [Rule Setup](#) page rather than shown as a column here.

Drilldown

Each finding can be drilled into to open the related record - the source document or the specific record that carries the offending value - so you can correct the data directly from the finding.

These findings are persisted from the last run. After you fix the data, re-run validation (or re-queue the document from the [Document Status](#) page) to refresh them.

Revision #1
