Versions

This page documents different version statuses of Squeeze. The aim is to highlight differences between on-premise and cloud clients and to provide decision-making support for selecting version statuses for updates.

General

Versioning

Squeeze is currently (Q4 2022) versioned using semantic versioning. An example based on version 2.3.1

- This is Squeeze in major version 2. Compared to Squeeze 1, incompatibilities may arise, which is why the major version number was increased to 2 at a given point in time.
- This is the third minor release within Squeeze 2. These releases add features and bug fixes that do not cause any particular problems with backward compatibility or, if unavoidable, explicitly document them.
  - For example, adding a new locator type or a new OCR would be appropriate here.
- The last digit ‘1’ documents that this version is the first patch for 2.3. In this patch, DEXPRO generally only implements bug fixes that cannot wait until the release of a new minor version. These versions therefore receive little to no new or modified features, so that updates to newer patches can be carried out without any problems.
